

Camera NVR

Camera NVR is a new feature available in Ocularis. Camera NVR takes advantage of the built-in recording capabilities of IP surveillance cameras and is available for all Ocularis models - Ocularis PS, Ocularis IS, Ocularis CS, Ocularis LS and Ocularis ES.

With Camera NVR, the traditional PC-based network video recorder (NVR) is eliminated and video recordings are stored on the camera's internal SD card (or network share for cameras that support that functionality). Each Camera NVR is managed as a single camera recording server in Ocularis and functions just like a camera attached to a traditional NVR.

With Camera NVRs you can:

- View live video
- Playback
- Timeslice
- Export and bookmark

There are no limitations on the number of Camera NVRs that can be managed in an Ocularis system and they can be used alongside standard PC-based NVRs under the Ocularis Mix & Match feature as part of a larger system.

Ocularis includes support for most Axis* and Samsung IP cameras as Camera NVRs. Support for additional manufacturers' cameras will be added in future Ocularis releases.

* Axis cameras must be initially configured to record using the free Axis Camera Companion application.
